Figure 1 is a line graph showing the time course of the effect of 100 mg/kg of diazepam on the plasma concentration of diazepam in rats. The x-axis is labeled 'Time' and ranges from 0 to 12 hours. The y-axis is labeled 'Plasma concentration (mg/ml)' and ranges from 0 to 1.0. There are two data series: one represented by open circles (○) and another by open squares (□). Both series show a peak concentration around 2-4 hours, followed by a decline. The open circles series generally shows higher concentrations than the open squares series after the initial peak.
